

When to use LinkedList?

- ① Frequent insertion/deletions in the middle
- ② Need both List and Deque operations
- ③ Order matters
- ⇒ Avoid if we need fast random access.

When to use Priority Queue?

- ⇒ Need elements processed by priority, not insertion order.
- ② Scheduling, shortest job first, Dijkstra, heaps

→ Doesn't maintain sorted iteration order

When to use Deque.

→ Stack or Queue

→ Faster replacement for Stack and LinkedList

When to use HashMap?

→ Fastest key-value access

→ Orders not matter

⇒ No ordering guarantee.

When to use TreeMap?

→ Keys must be sorted

→ Range queries

→ Slower than HashMap.

When to use HashSet?

→ Store unique elements

→ Fast lookup, no duplicates

→ No order guarantee.
